

Briefing

The pizza shop app is designed for three user classes: students, cafeteria employees, and cafeteria managers. For students, the app is a typical pizza ordering software. For employees, it functions as a quantity checker. Based on student's orders, they can see how many of a type of pizza needs to be made and track how many have already been made. Managers act as administrative role. They can manually adjust the number of pizzas required in case there's some shortage/overage as well as add or remove a pizza type. The tasks may take place across one or more of the user classes.

In summary:

- students - place orders
- employees - prepare pizzas/orders
- managers - adjust pizza quantities/availabilities
